Evan Reginold

These prodentim customer reviews give us the impression that ProDentim had a **positive effect** on many of the customers. Going by the ProDentim review, the oral supplement has offered solutions to some most common dental problems such as gum disease such as gingivitis, and bad breath. A customer even responded that it has helped him overcome toothache owing to hyper tooth sensitivity. It seems the prodentim dental health supplement also has offered a solution to bad breath and poor dental hygiene which is one of the most common concerns that many people have. However, we did have some feedbacks that tell us that the dental health supplement did not produce an instant result of gum problems. It hints at the fact that it may act variably to some common oral health problems and it depends largely on the individual's health and the gravity of the dental problem.

## Clinical Studies and Research Of ProDentim

The efficacy of **probiotics** in rendering health benefits is well acknowledged by the US National Library of Medicine (NIC) in a critical review done on the subject, Probiotics, and **Oral Health**. The review mainly focuses on probiotic strains of **Lactobacillus** and **Bifidobacterium** that feature in the ProDentim formulation.

Furthermore, the NIC observes that probiotics do have great potential in rendering substantial oral benefits and to effectively tap into those benefits further studies should be conducted in that direction.

Another clinical study conducted by the NIH reveals that probiotics have the potential in managing periodontal and gum diseases, and dental caries by effectively addressing the host-microbial interface.

Moreover, the NIH concludes that oral probiotics alone could have an important role to play in the clinical management of chronic dental diseases. These studies point out the importance that oral probiotics have and the role they could play in providing sustainable results by fighting the toxins and harmful bacteria that resides in the oral cavity.

In the dental supplements industry, it is very much possible to find fraudulent products that promise fast relief to various dental problems. # How To Improve Oral Hygiene Naturally?

The key to an overall healthy mouth is good oral hygiene. Oral hygiene does not only keep your teeth white and fresh breath but also promotes healthy teeth, gum, and cavity. With little care, you can prevent many oral health issues and improve oral health easily. There are many ways in which a person can maintain good oral hygiene and a healthy mouth environment, and some of them are discussed below:

## Brush Regularly

Brushing regularly, twice a day is one of the best ways to improve your oral hygiene naturally. Brushing will remove foods and plaque from your teeth and ensure that your mouth is protected from any bacteria that cause issues like gum diseases and also prevents tooth decay. Brushing also removes any toxins or debris from your mouth and improves [oral health](#).

One main thing you need to keep in mind is that you should not brush aggressively. Brushing aggressively will not prevent tooth decay but instead speeds up the process. When you are not brushing the right way, the tooth enamel will wear out which will cause any dental health issues.

## Floss At Least Once A Day

Flossing comes in importance as it can reach people where a toothbrush can't go. It will remove plaque from the gum line and also helps in removing food particles stuck in your gums. Flossing also prevents tooth decay and reduces the chances of gum inflammation.

You need to floss your teeth at least once a day and you can do it after eating a meal. This will clear up any plaque from your teeth and aid in maintaining a healthy mouth environment.

# **Eat Calcium And Vitamin D Rich Foods**

Calcium and vitamin D-rich foods are the ones recommended by many dental health experts to maintain an overall healthy mouth. Eating foods with calcium in it will strengthen your enamel and help with gum inflammation. Some of the natural sources of calcium are beans, almonds, leafy green vegetables, and dairy products like milk, yogurt, and cheese.

Vitamin D is a substance that can majorly contribute to preventing tooth decay and gum disease. It also enhances your teeth' immune health and promotes healthy inflammation. Some foods that contain vitamin D in it are fish like tuna, salmon, and sardines and also beef liver, cold liver oil, and mushrooms.

## **Drink Enough Water**

Water is a very efficient tooth and mouth cleaner and offers many oral health benefits such as strengthening your enamel and preventing dry mouth. Drinking enough water will also reduce the chance of gum disease and keep your teeth healthy.

One of the best things about water is that it does not contain additives or sugar substances that might damage your teeth. Therefore, you can drink it as much as you want to enhance your oral health. Filtered and bottled water is better when it comes to oral health compared to tap water.
